This volume is part of a series of Space Flight Handbooks. The complete series consists of the following:

Volume 1 Orbital Flight Handbook, NASA SP-33

- Part 1
- Part 2
- Part 3

Volume 2 Lunar Flight Handbook, NASA SP-34

- Part 1
- Part 2
- Part 3

Volume 3 Planetary Flight Handbook, NASA SP-35

- Part 1
- Part 2
- Part 3

EXPLANATORY SUPPLEMENT TO PARTS 2 AND 3

Parts 2 and 3 present tabulations of trajectory data for scheduling flights to and from Venus and Mars during the period 1960-2000. Part 2 contains information for outbound flights to these planets; Part 3 contains information for trajectories returning from the planets to Earth. Each Part contains data for single-plane transfers, as well as for broken-plane transfers which employ a midcourse plane-change to eliminate the high speed "ridges." The mathematical analyses employed for all calculations are described in Part 1 of this handbook.

To facilitate the construction of round-trip trajectories, the date at the target planet is held fixed while the trip duration is varied in 10-day increments from zero days to the length of that planet's synodic period with Earth. Dates of arrival *at* the target planet are presented in the extreme right-hand column of Part 2, and dates of departure *from* the target planet are presented in the extreme left-hand column of Part 3. Thus, by holding Part 2 directly to the left of Part 3, the analyst may easily and rapidly scan all trip possibilities which involve any desired stopover time at the target planet.

Within approximately ± 200 days of each conjunction or opposition, data are presented in 10-day increments at the target planet. Only those trips are listed for which the hyperbolic excess speeds at either or both ends of the trajectory do not exceed 0.6 EMOS.

For the remaining mission regions, the requirements are so smoothly varying that a 50-day interval in dates at the target planet may be employed; the 10-day interval in trip times is, however, preserved here. In these regions, only those trips are listed for which either or both speeds do not exceed 0.3 EMOS.*

---

*This subject is discussed at greater length in Part I.

For each departure-arrival date pair, all trajectories are listed which connect the given planets on those dates. This tabulation accounts for all possible multiple-circuit arcs but does not include retrograde heliocentric flights.

The machine program used to generate the tables contains an internal ephemeris routine which treats all planetary orbits as eccentric, mutually inclined ellipses which are fixed in space. The planetary orbital parameters adopted for the program have been extracted chiefly from the Explanatory Supplement to the British Ephemeris and are presented in Tables 2 and 3, Part 1 of this handbook; they are not purported to be the most accurate or up-to-date values obtainable for these constants; however, they are entirely in keeping with the fixed-ellipse model adopted for the calculations, and also with the limited-accuracy requirements for preliminary design data.

The information is arranged in convenient columnar groupings. As mentioned above, dates are presented at either the extreme left or the extreme right of each page. The remaining data are divided roughly into three sections, comprising (reading from left to right) six columns of parameters pertinent to the departure operation, six columns pertinent to the heliocentric phase, and six columns pertinent to the arrival operation. The departure and arrival groupings are each further subdivided into listings of heliocentric and planet-centered data. Hyperbolic excess speeds, which are generally of foremost preliminary concern, are placed as far toward the side margins as is possible, to facilitate rapid scanning.

The use of these data for trips to Mars during 1980-2000, and for trips to Venus during 1964-1970, 1986-2000, is discussed in Part 1.

The data were calculated on the IBM 7094 computer, and listed on the IBM 1401 printer. Master sheets were photographically reduced by 50 percent for the present printing.

Conventions and Symbols for Single-Plane Transfers

Column	Symbol	Explanation
1	SPEED	Magnitude (speed) of hyperbolic excess departure velocity vector, normalized to Earth's mean orbital speed.
2	R A	Right ascension of hyperbolic excess departure velocity vector (hyperbola asymptote); measured in degrees along the local planetary equator eastward from the "vernal equinox," i.e., where the Sun's path rises above the departure planet's equator. For Venus, since the orientation of the planetary North Pole is unknown, the equator has been assumed coplanar with the orbit, and the "vernal equinox" of Venus is taken in the direction of its orbital perihelion.
3	DECL	Declination of hyperbolic excess departure velocity vector, measured in degrees positively northward and negatively southward from the planet's equator.
4	I 1	Inclination of transfer orbit to departure planet's orbit, in degrees; zero is forward, -90° is perpendicular southward, +90° is perpendicular northward, and ±180° is backward.
5	V 1	Heliocentric speed of departure, normalized to Earth's mean orbital speed.
6	PSI 1	Heliocentric angle of departure, in degrees; measured counterclockwise from the outward heliocentric radius vector to the departure velocity vector in the transfer plane. (See Fig. A.)
7	ECCEN	Eccentricity of heliocentric transfer orbit.
8	SMA	Semimajor axis of the transfer conic, in AU .
9	THET 1	True anomaly of departure point, measured in the transfer orbit in degrees, reduced to $0 \leq \theta_1 \leq 360°$. (See Fig. A.)
10	THET 2	True anomaly of arrival point measured in the transfer orbit, in degrees; THET 2 minus THET 1 equals the heliocentric transfer angle L. (See Fig. A.)
11	PERIH	Perihelion distance of the transfer conic, in AU . This value is listed only if the vehicle traverses the perihelion during the transfer.

12	APHEL	Aphelion distance of the transfer conic, in AU . This value is listed only if the vehicle traverses the aphelion during the transfer.
13	I 2	Inclination of transfer orbit to arrival planet's orbit, in degrees; if approach is directly from the rear (i.e., the arrival vector points in the same direction as the planet's motion), then I 2 = 0° , etc.
14	V 2	Heliocentric arrival speed, normalized to Earth's mean orbital speed.
15	PSI 2	Heliocentric angle of arrival, in degrees, measured clockwise from the inward heliocentric radius vector to the arrival velocity vector in the transfer plane. (See Fig. A.) Note that this angle is measured opposite in sense to PSI 1 .
16	R A	Analogous to departure velocity case; note, however, that this is the right ascension of the position at which the arrival velocity vector would emerge again from the planet's celestial sphere. This convention for reckoning asymptote directions is useful when calculating flyby round trips. When the trajectory is unperturbed by the target planet, the approach and departure asymptotes have exactly the same right ascensions and declinations. By noting the discrepancies between the two asymptotes in other cases, the analyst may obtain a rough but rapid estimate of the bend angle without performing trigonometric calculations.
17	DECLIN	Declination of the position at which the arrival velocity vector would emerge again from the planet's celestial sphere.
18	SPEED	Magnitude (speed) of hyperbolic excess arrival velocity vector, normalized to Earth's mean orbital speed.

The following two listings appear on the right-hand side of the page for transfers from Earth to the target planet, and on the left-hand side, in this same order, for transfers from the target planet to Earth.

19	DEPART	Julian date of departure, reckoned from JD 240-0000.
20	ARRIVE	Julian date of arrival, reckoned from JD 240-0000.

The following conventions and symbols apply to the listings of broken-plane transfers (using midcourse plane changes):

4	I 1	Inclination of the first transfer plane to the departure planet's plane of motion. Conventions are analogous to the single-plane transfers.
6	PSI 1	Heliocentric departure angle, measured in the first transfer plane. Conventions analogous to the single-plane transfers.
7	MID-V	Heliocentric speed (in EMOS) immediately before application of the plane change.
8	KICK-V	Incremental velocity required for the plane-change maneuver, in EMOS. Positive quantity signifies an impulse applied northward; a negative quantity signifies a southward-directed impulse application.
9	DATE	Date of application of the plane-change maneuver, reckoned from JD 240-0000
12	I 2	Inclination of the second transfer plane to the arrival planet's plane of motion. Conventions analogous to the single-plane transfers.
14	PSI 2	Heliocentric arrival angle, measured in the second transfer plane. Conventions analogous to the single-plane transfers.

All other quantities are exactly equivalent in sense to the single-plane transfer cases.
